

MARCIN WRZOŚ

Full Stack Developer

+48 662 623 531 • Wrocław, Poland • linkedin.com/in/marcin-wrzoś • marcinwrzs.github.io/Portfolio

SUMMARY

Full Stack Developer combining strong engineering skills (React, TypeScript, Angular, Java/Spring Boot, Terraform, CI/CD, AWS) with a background in the financial industry. Experienced across serverless SaaS platforms, IoT systems with full mobile release pipelines, and enterprise applications for the public sector with strict security and documentation requirements.

EXPERIENCE

Full Stack Developer

BCF Software Sep 2025 – Present

Working across several parallel client projects — from serverless SaaS architecture to enterprise Java systems and process automation (RPA).

VML — SaaS platform for interactive, personalized video (martech)

Stack: React, TypeScript, Node.js, AWS Lambda, DynamoDB, Terraform, GitHub Actions, Jest

- Developed core editor and backend features: project version history with cursor-based pagination in DynamoDB, a reusable widget library (full CRUD with an animation and trigger editor), and project merging with cross-project S3 asset migration.
- Worked on infrastructure: configured Terraform for a multi-region, multi-account AWS environment, resolved CI/CD pipeline blockers (GitHub Actions), and enabled structured logging and DynamoDB Streams for observability.

Remote Ally — IoT platform for remote video monitoring and device fleet management (live on the App Store and Google Play)

Stack: React, TypeScript, Capacitor, Python/FastAPI, Terraform, AWS (ECS, Cognito, IoT Core), Docker, Codemagic

- Involved in every stage of the project — frontend, backend, and infrastructure — including CI/CD and the mobile release process.
- Took part in publishing the app to the Apple App Store and Google Play: build signing, keystore management, and release automation via Codemagic (iOS) and GitHub Actions (Android).
- Designed environment configuration using AWS SSM Parameter Store as a contract between Terraform and CI/CD pipelines, keeping secrets out of the repository.
- Diagnosed and fixed a race condition on first user login and a stuck rolling deployment on ECS (resolved via dynamic port mapping).
- Direct client contact — gathering requirements, presenting solutions, aligning on release priorities.

Public Sector — Document Workflow & Automated Data Transfer Systems

Two systems delivered for a public-sector client, both operating under strict security and audit requirements.

→ Document Workflow & Case Management System (legacy migration)

Stack: Java, Spring Boot, Angular, TypeScript, PostgreSQL, Docker, GitLab CI, Playwright

- Migrated a legacy system (PHP/MySQL) to a modern stack (Java 17/Spring Boot, Angular, PostgreSQL), deployed in a closed, air-gapped network with full role-based access control and audit logging.
- Implemented core workflow features, including document versioning, role-based field-level permissions, and case archiving.
- Authored technical and functional documentation, including a software license compliance review of all open-source dependencies.
- Contributed to several rounds of code quality improvements (SonarQube) across the codebase without breaking the API contract.

→ Automated Data Transfer System (Robotic Process Automation)

Stack: Java, Spring Boot, Angular, TypeScript, PostgreSQL, Playwright, Docker, GitLab CI, k6

- Contributed to a robotic process automation (RPA) module that automates data entry into an external web system, replacing manual, repetitive data transcription.
- Built a reporting module (multiple report types, CSV/XLSX/PDF export) and a real-time notification system (WebSocket/STOMP with an email outbox queue).
- Developed input validation and normalization logic for data submitted to the external system, including detection and controlled correction of non-standard characters, fully logged in the audit trail.
- Set up performance testing (k6) and a dedicated performance-testing stage in the CI pipeline.
- Authored technical documentation and a documentation generation tool (Python) producing PDF and wiki-ready output.

Frontend Developer

Exa22 Feb 2024 – Aug 2025

Stack: React, TypeScript, Redux, AWS S3, NATS, Jest

- Designed and developed a cloud-based telemetry system connecting devices to a web portal (React, TypeScript).
- Designed and maintained interfaces for vending machines ("Kwiatomaty") in React.js, including an admin panel for managing devices, products, and real-time payments (NATS).
- Integrated frontend applications with AWS services (S3) for image storage and retrieval.
- Wrote unit tests for frontend applications using Jest.

Non-IT Jobs in Investment Banking

Wrocław Jan 2018 – Jan 2024

- Process automation in VBA and Power BI.
- Supported daily financial operations and ensured accuracy in data reconciliation, reporting, and Excel-based tracking of key performance indicators.

TECHNICAL SKILLS

React, TypeScript, JavaScript, Angular, Java, Spring Boot, Python, Node.js, Terraform, Docker, CI/CD (GitHub Actions, GitLab CI, Codemagic), AWS (Lambda, ECS, S3, DynamoDB, IoT Core, Cognito), PostgreSQL, DynamoDB, Redux, Jest, SQL

EDUCATION

University of Economics in Wrocław — MSc, Finance and Accounting, 2017–2019

University of Wrocław — BA, National Security, 2014–2017
